

LRIS2K

2048-bit EEPROM tag IC at 13.56 MHz, with 64-bit UID and Password, ISO15693 and ISO18000-3 Mode 1 compliant

Features

- ISO 15693 standard fully compliant
- ISO 18000-3 Mode 1 standard fully compliant
- 13.56 MHz ±7 kHz carrier frequency
- To tag: 10% or 100% ASK modulation using 1/4 (26 Kbit/s) or 1/256 (1.6 Kbit/s) pulse position coding
- From tag: Load modulation using Manchester coding with 423 kHz and 484 kHz subcarriers in Low (6.6 Kbit/s) or High (26 Kbit/s) data rate mode. Supports the 53 Kbit/s data rate with Fast commands
- Internal tuning capacitor 21 pF
- 1 000 000 Erase/Write cycles (minimum)
- 40 year data retention (minimum)
- 2048-bits EEPROM with Block Lock feature
- 64-bit unique identifier (UID)
- Electrical article surveillance (EAS) capable (software controlled)
- Kill function
- Multipassword protection
- Read & Write (block of 32 bits)
- 5 ms programming time

LRIS2K Description

1 Description

The LRIS2K is a contactless memory powered by the received carrier electromagnetic wave, which follows the ISO 15693 recommendation for radio frequency power and signal interface. It is a 2048-bit electrically erasable programmable memory (EEPROM). The memory is organized as 64 blocks of 32 bits. The LRIS2K is accessed via the 13.56 MHz carrier electromagnetic wave on which incoming data are demodulated from the received signal amplitude modulation (ASK: amplitude shift keying). The received ASK wave is 10% or 100% modulated with a data rate of 1.6 Kbit/s using the 1/256 pulse coding mode or a Data rate of 26 Kbit/s using the 1/4 pulse coding mode.

Outgoing data are generated by the LRIS2K load variation using Manchester coding with one or two subcarrier frequencies at 423 KHz and 484 kHz. Data are transferred from the LRIS2K at 6.6 Kbit/s in low data rate mode and 26 Kbit/s high data rate mode. The LRIS2K supports the 53 Kbit/s in high data rate mode in one subcarrier frequency at 423 kHz.

The LRIS2K also features a unique 32-bit multi-password protection scheme.

| AC0 | Antenna coil |

Description LRIS2K

1.1 Memory mapping

The LRIS2K is divided into 64 blocks of 32 bits as shown in *Table 2*. Each block can be individually read- and/or write-protected using a specific lock or password command.

The user area consists of blocks that are always accessible. Read and Write operations are possible if the addressed block is not protected. During a Write, the 32 bits of the block are replaced by the new 32-bit value.

The LRIS2K also has a 64-bit block that is used to store the 64-bit unique identifier (UID). The UID is compliant with the ISO 15963 description, and its value is used during the anticollision sequence (Inventory). This block is not accessible by the user and its value is written by ST on the production line.

The LRIS2K also includes an AFI register in which the application family identifier is stored, and a DSFID register in which the data storage family identifier used in the anticollision algorithm is stored. The LRIS2K has four additional 32-bit blocks in which the Kill code and the password codes are stored.

LRIS2K Description

1.2 Commands

The LRIS2K supports the following commands:

- Inventory, used to perform the anticollision sequence.
- **Stay Quiet**, used to put the LRIS2K in quiet mode, where it does not respond to any inventory command.
- **Select**, used to select the LRIS2K. After this command, the LRIS2K processes all Read/Write commands with Select_flag set.
- Reset To Ready, used to put the LRIS2K in the ready state.
- Read Block, used to output the 32 bits of the selected block and its locking status.
- Write Block, used to write the 32-bit value in the selected block, provided that it is not locked
- Lock Block, used to lock the selected block. After this command, the block cannot be modified.
- Write AFI, used to write the 8-bit value in the AFI register.
- Lock AFI, used to lock the AFI register.
- Write DSFID, used to write the 8-bit value in the DSFID register.
- Lock DSFID, used to lock the DSFID register.
- Get System Info, used to provide the system information value
- Get Multiple Block Security Status, used to send the security status of the selected block.
- *Initiate*, used to trigger the tag response to the Inventory Initiated sequence.
- Inventory Initiated, used to perform the anticollision sequence triggered by the Initiate
 command.
- Kill, used to definitively deactivate the tag.
- Write Password, used to write the 32 bits of the selected password.
- Lock Password, used to write the Protect Status bits of the selected block.
- Present Password, enables the user to present a password to unprotect the user blocks linked to this password.
- Fast Initiate, used to trigger the tag response to the Inventory Initiated sequence.
- Fast Inventory Initiated, used to perform the anticollision sequence triggered by the Initiate command.
- Fast Read Single Block, used to output the 32 bits of the selected block and its locking status.

Description LRIS2K

1.3 Initial dialogue for vicinity cards

The dialog between the vicinity coupling device (VCD) and the vicinity integrated circuit Card or VICC (LRIS2K) takes place as follows:

- activation of the LRIS2K by the RF operating field of the VCD.
- transmission of a command by the VCD.
- transmission of a response by the LRIS2K.

These operations use the RF power transfer and communication signal interface described below (see *Power transfer*, *Frequency* and *Operating field*). This technique is called RTF (Reader Talk First).

1.3.1 Power transfer

Power is transferred to the LRIS2K by radio frequency at 13.56 MHz via coupling antennas in the LRIS2K and the VCD. The RF operating field of the VCD is transformed on the LRIS2K antenna to an AC Voltage which is rectified, filtered and internally regulated. The amplitude modulation (ASK) on this received signal is demodulated by the ASK demodulator.

1.3.2 Frequency

The ISO 15693 standard defines the carrier frequency (f_C) of the operating field as 13.56 MHz \pm 7 kHz.

1.3.3 Operating field

The LRIS2K operates continuously between H_{min} and H_{max} .

- The minimum operating field is H_{min} and has a value of 150 mA/m rms.
- The maximum operating field is H_{max} and has a value of 5 A/m rms.

A VCD shall generate a field of at least H_{min} and not exceeding H_{max} in the operating volume.

2 LRIS2K block security

The LRIS2K provides a special protection mechanism based on passwords. Each memory block of the LRIS2K can be individually protected by one out of three available passwords, and each block can also have Read/Write access conditions set.

Each memory block of the LRIS2K is assigned with a Protect Status area including a Block Lock bit, two Password Control bits and two Read/Write protection bits as shown in *Table 4*. *Table 4* describes the organization of the Protect status area which can be read using the Read Single Block command with the Option_flag set to '1', and the Get Multiple Block Security status command.

Table 3. Memory blocks with protect status area

| Add | 0 | 7 | 8 15 | 16 | 23 | 24 | 31 | Protect status |
|-----|---|--------|--------|------|----|----|----|----------------|
| 0 | | | 5 bits | | | | | |
| 1 | | 5 bits | | | | | | |
| | | | User | area | | | | 5 bits |

Table 4. Protect status area organization

| _ | b ₇ | b ₆ | b ₅ | b ₄ | b ₃ | b ₂ | b ₁ | b ₀ | |
|---|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|--|
| | 0 | 0 | 0 | Password Co | ntrol bits | Read / Write | • | Block Lock | |

When the Block Lock bit is set to '1', for instance by issuing a Block Lock command, the 2 Read/Write protection bits (b_1, b_2) are used to set the Read/Write access of the block as described in *Table 5*.

The next 2 bits of the Protect Status area (b_3, b_4) are the Password Control bits. The value of these two bits is used to link a password to the block as defined in *Table 5*.

Combinations not described in Table 5 are reserved.

Table 5. Read / Write protection bit setting and block protection status

| | k lock ction | Password Control bits | | ess when | | ess when | Block protection status | |

| 1 | 11 | 11 | READ NO WRITE | | NO READ | NO WRITE | the block is protected by password 3 | |
| 1 | 00 | 00 | Not applicable | | READ | NO WRITE | the block is not protected by a password | |

The LRIS2K password protection is organized around a dedicated set of commands plus a system area of four password blocks where the password values and the Kill code are stored. Each password block also has a Protect Status area, making it possible to set the Read / Write access right of each individual block. This system area is described in *Table 6*.

Table 6. Password system area

| Add | 0 | 7 | 8 | 15 | 16 | 2 | 23 | 24 | 31 | Protect status | | | |
|-----|------------|-------------------|---|----|----|---|----|--------|--------|----------------|--|--|--|
| 0 | Kill code | | | | | | | | 5 bits | | | | |
| 1 | | Password 1 5 bits | | | | | | | | 5 bits | | | |
| 2 | Password 2 | | | | | | | | 5 bits | | | | |
| 3 | Password 3 | | | | | | | 5 bits | | | | | |

The dedicated password commands are:

Write Password:

The Write Password command is used to write a 32-bit block into the password system area. This command must be used to write or update password values and to set the kill code. Depending on the Read/Write access set in the Protect Status area, it is possible to modify a password value after issuing a valid Present Password command.

Lock Password:

The Lock Password command is used to set the Protect Status area of the selected block. Bits b_4 to b_1 of the Protect Status are affected by the Lock Password command. The Block Lock bit, b_0 , is set to '1' automatically. After issuing a Lock Password command, the protection settings of the selected block are activated. The protection of a locked block cannot be changed. A Lock Password command sent to a locked block returns an error code.

The Lock Password command is also used to set the Protect Status areas of the password blocks. RFU bit 8 of the Request_flag is used to select either the memory area (bit 8 = '0') or the password area (bit 8 = '1').

Present Password:

The Present Password command is used to present one of the three passwords to the LRIS2K in order to modify the access rights of all the memory blocks linked to that password (*Table 5*) including the password itself. If the presented password is correct, the access rights remain activated until the tag is powered off or until a new Present Password command is issued.

3 Example of LRIS2K security protection

Table 7 and Table 8 show the block security protections before and after a valid Present Password command. The Table 7 shows blocks access rights of an LRIS2K after power-up. After a valid Present Password command with password 1, the memory block access is changed as given in Table 8.

Table 7. LRIS2K block security protection after power-up

4 Communication signal from VCD to LRIS2K

Communications between the VCD and the LRIS2K takes place using the modulation principle of ASK (Amplitude Shift Keying). Two modulation indexes are used, 10% and 100%. The LRIS2K decodes both. The VCD determines which index is used.

The modulation index is defined as [a - b]/[a + b] where a is the peak signal amplitude and b, the minimum signal amplitude of the carrier frequency.

Depending on the choice made by the VCD, a "pause" will be created as described in *Figure 2* and *Figure 3*.

The LRIS2K is operational for any degree of modulation index from between 10% and 30%.

Figure 2. 100% modulation waveform

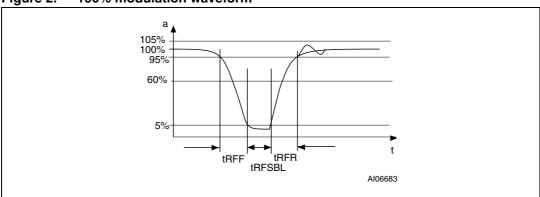

Table 9. 10% modulation parameters

| Symbol | Parameter definition | Value |
|--------|----------------------|-------|
| hr | 0.1 x (a – b) | max |
| hf | 0.1 x (a – b) | max |

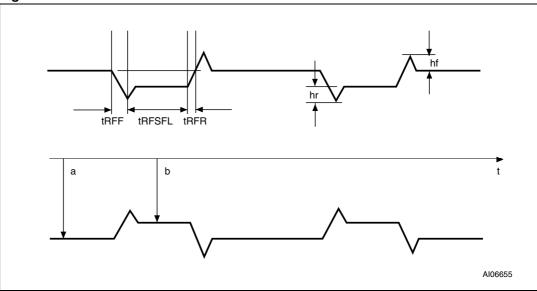

Figure 3. 10% modulation waveform

Data rate and data coding 5

The data coding implemented in the LRIS2K uses pulse position modulation. Both data coding modes that are described in the ISO15693 are supported by the LRIS2K. The selection is made by the VCD and indicated to the LRIS2K within the start of frame (SOF).

5.1 Data coding mode: 1 out of 256

The value of one single byte is represented by the position of one pause. The position of the pause on 1 of 256 successive time periods of 18.88 μ s (256/ f_C), determines the value of the byte. In this case the transmission of one byte takes 4.833 ms and the resulting data rate is 1.65 kbits/s (f_C/8192).

Figure 4 illustrates this pulse position modulation technique. In this figure, data E1h (225 decimal) is sent by the VCD to the LRIS2K.

The pause occurs during the second half of the position of the time period that determines the value, as shown in Figure 5.

A pause during the first period transmits the data value 00h. A pause during the last period transmit the data value FFh (255 decimal).

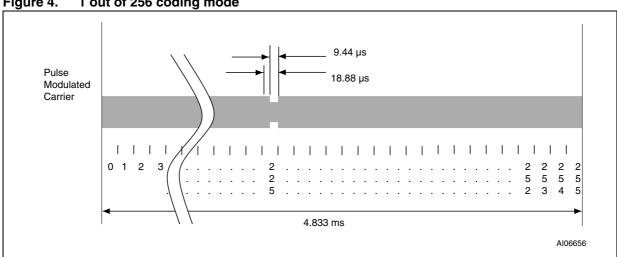

Figure 4. 1 out of 256 coding mode

Pulse Modulated Carrier

22 2 2 2 6 5 6 Time Period one of 256 Al06657

Figure 5. Detail of a time period

5.2 Data coding mode: 1 out of 4

The value of 2 bits is represented by the position of one pause. The position of the pause on 1 of 4 successive time periods of 18.88 μ s (256/ f_C), determines the value of the 2 bits. Four successive pairs of bits form a byte, where the least significant pair of bits is transmitted first.

In this case the transmission of one byte takes 302.08 μ s and the resulting data rate is 26.48 Kbits/s ($f_C/512$). *Figure 6* illustrates the 1 out of 4 pulse position technique and coding. *Figure 7* shows the transmission of E1h (225d - 1110 0001b) by the VCD.

Figure 6. 1 out of 4 coding mode

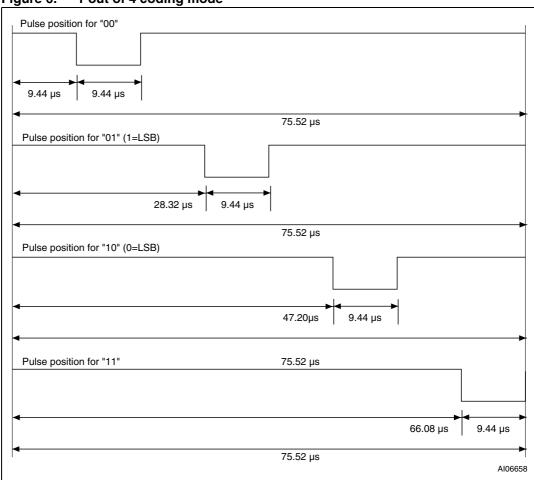

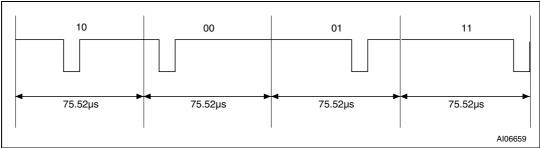

Figure 7. 1 out of 4 coding example

5.3 VCD to LRIS2K frames

Frames are delimited by a start of frame (SOF) and an end of frame (EOF). They are implemented using code violation. Unused options are reserved for future use.

The LRIS2K is ready to receive a new command frame from the VCD 311.5 μ s (t_2) after sending a response frame to the VCD.

The LRIS2K takes a power-up time of 0.1 ms after being activated by the powering field. After this delay, the LRIS2K is ready to receive a command frame from the VCD.

5.4 Start of frame (SOF)

The SOF defines the data coding mode the VCD is to use for the following command frame. The SOF sequence described in *Figure 8* selects the 1 out of 256 data coding mode. The SOF sequence described in *Figure 9* selects the 1 out of 4 data coding mode. The EOF sequence for either coding mode is described in *Figure 10*.

Figure 8. SOF to select 1 out of 256 data coding mode

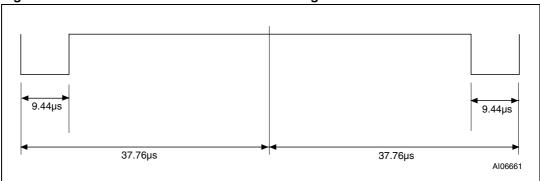

Figure 9. SOF to select 1 out of 4 data coding mode

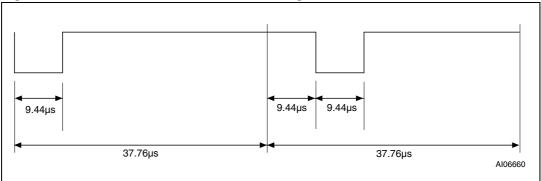

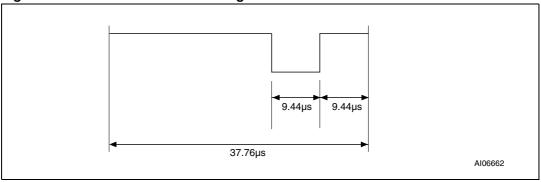

Figure 10. EOF for either data coding mode

6 Communications signal from LRIS2K to VCD

The LRIS2K has several modes defined for some parameters, owing to which it can operate in different noise environments and meet different application requirements.

6.1 Load modulation

The LRIS2K is capable of communication to the VCD via an inductive coupling area whereby the carrier is loaded to generate a subcarrier with frequency f_S . The subcarrier is generated by switching a load in the LRIS2K.

The load-modulated amplitude received on the VCD antenna must be of at least 10mV when measured as described in the test methods defined in International Standard ISO10373-7.

6.2 Subcarrier

The LRIS2K supports the one-subcarrier and two-subcarrier response formats. These formats are selected by the VCD using the first bit in the protocol header. When one subcarrier is used, the frequency f_{S1} of the subcarrier load modulation is 423.75 kHz (f_C /32). When two subcarriers are used, the frequency f_{S1} is 423.75 kHz (f_C /32), and frequency f_{S2} is 484.28 kHz (f_C /28). When using the two-subcarrier mode, the LRIS2K generates a continuous phase relationship between f_{S1} and f_{S2} .

6.3 Data rates

The LRIS2K can respond using the low or the high data rate format. The selection of the data rate is made by the VCD using the second bit in the protocol header. It also supports the x2 mode available on all the Fast commands. *Table 10* shows the different data rates produced by the LRIS2K using the different response format combinations.

Table 10. Response data rates

| | Data rate | One subcarrier | Two subcarriers |
|-------|-------------------|--------------------------------------|-------------------------------------|
| Low | Standard commands | 6.62 Kbits/s (f _c /2048) | 6.67 Kbits/s (f _c /2032) |
| Low | Fast commands | 13.24 Kbits/s (f _C /1024) | not applicable |
| Lligh | Standard commands | 26.48 Kbits/s (f _C /512) | 26.69 Kbits/s (f _c /508) |
| High | Fast commands | 52.97 Kbits/s (f _c /256) | not applicable |

7 Bit representation and coding

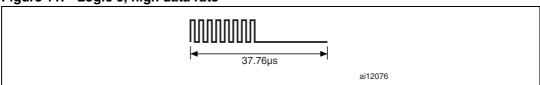

Data bits are encoded using Manchester coding, according to the following schemes. For the low data rate, same subcarrier frequency or frequencies is/are used, in this case the number of pulses is multiplied by 4 and all times will increase by this factor. For the Fast commands using one subcarrier, all pulse numbers and times are divided by 2.

7.1 Bit coding using one subcarrier

7.1.1 High data rate

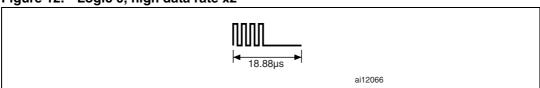

A logic 0 starts with 8 pulses at 423.75 kHz ($f_{\rm C}/32$) followed by an unmodulated time of 18.88 μ s as shown in *Figure 11*.

Figure 11. Logic 0, high data rate

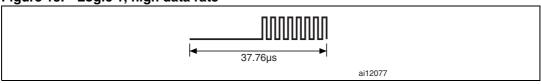

For the fast commands, a logic 0 starts with 4 pulses at 423.75 kHz ($f_C/32$) followed by an unmodulated time of 9.44 μ s as shown in *Figure 12*.

Figure 12. Logic 0, high data rate x2

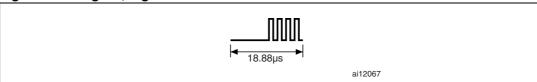

A logic 1 starts with an unmodulated time of 18.88 μ s followed by 8 pulses at 423.75 kHz (f_C/32) as shown in *Figure 13*.

Figure 13. Logic 1, high data rate

For the Fast commands, a logic 1 starts with an unmodulated time of 9.44 μ s followed by 4 pulses of 423.75 kHz (f_C/32) as shown in *Figure 14*.

Figure 14. Logic 1, high data rate x2

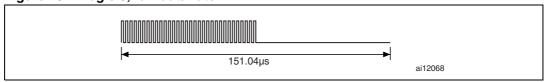

26/98 Doc ID 13888 Rev 9

7.1.2 Low data rate

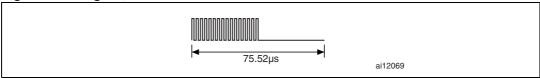

A logic 0 starts with 32 pulses at 423.75 kHz ($f_{\rm C}/32$) followed by an unmodulated time of 75.52 μs as shown in *Figure 15*.

Figure 15. Logic 0, low data rate

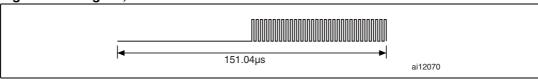

For the Fast commands, a logic 0 starts with 16 pulses at 423.75 kHz ($f_C/32$) followed by an unmodulated time of 37.76 μ s as shown in *Figure 16*.

Figure 16. Logic 0, low data rate x2

A logic 1 starts with an unmodulated time of 75.52 μ s followed by 32 pulses at 423.75 kHz (f_C/32) as shown in *Figure 17*.

Figure 17. Logic 1, low data rate

For the Fast commands, a logic 1 starts with an unmodulated time of 37.76 μ s followed by 16 pulses at 423.75 kHz (f_C/32) as shown in *Figure 17*.

Figure 18. Logic 1, low data rate x2

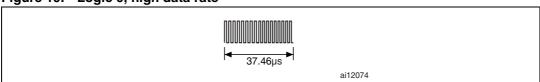

7.2 Bit coding using two subcarriers

7.3 High data rate

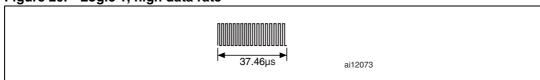

A logic 0 starts with 8 pulses at 423.75 kHz ($f_C/32$) followed by 9 pulses at 484.28 kHz ($f_C/28$) as shown in *Figure 19*. For the Fast commands, the x2 mode is not available.

Figure 19. Logic 0, high data rate

A logic 1 starts with 9 pulses at 484.28 kHz ($f_C/28$) followed by 8 pulses at 423.75 kHz ($f_C/32$) as shown in *Figure 20*. For the Fast commands, the x2 mode is not available.

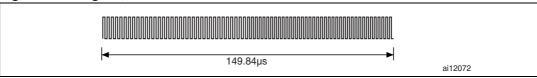

Figure 20. Logic 1, high data rate

7.4 Low data rate

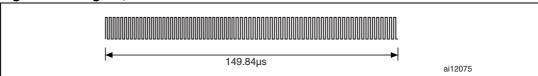

A logic 0 starts with 32 pulses at 423.75 kHz (f_C /32) followed by 36 pulses at 484.28 kHz (f_C /28) as shown in *Figure 21*. For the Fast commands, the x2 mode is not available.

Figure 21. Logic 0, low data rate

A logic 1 starts with 36 pulses at 484.28 kHz ($f_{\rm C}/28$) followed by 32 pulses at 423.75 kHz ($f_{\rm C}/32$) as shown in *Figure 22*. For the Fast commands, the x2 mode is not available.

LRIS2K LRIS2K to VCD frames

8 LRIS2K to VCD frames

Frames are delimited by an SOF and an EOF. They are implemented using code violation. Unused options are reserved for future use. For the low data rate, the same subcarrier frequency or frequencies is/are used. In this case the number of pulses is multiplied by 4. For the Fast commands using one subcarrier, all pulse numbers and times are divided by 2.

8.1 SOF when using one subcarrier

8.2 High data rate

The SOF includes an unmodulated time of 56.64 μ s, followed by 24 pulses at 423.75 kHz (f_C/32), and a logic 1 that consists of an unmodulated time of 18.88 μ s followed by 8 pulses at 423.75 kHz as shown in *Figure 23*.

Figure 23. Start of frame, high data rate, one subcarrier

For the Fast commands, the SOF comprises an unmodulated time of 28.32 μ s, followed by 12 pulses at 423.75 kHz (f_C/32), and a logic 1 that consists of an unmodulated time of 9.44 μ s followed by 4 pulses at 423.75 kHz as shown in *Figure 24*.

Figure 24. Start of frame, high data rate, one subcarrier x2

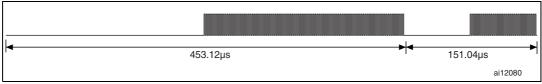

LRIS2K to VCD frames LRIS2K

8.3 Low data rate

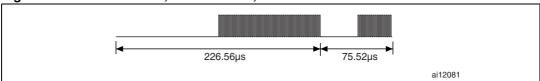

The SOF comprises an unmodulated time of 226.56 μ s, followed by 96 pulses at 423.75 kHz ($f_C/32$), and a logic 1 that consists of an unmodulated time of 75.52 μ s followed by 32 pulses at 423.75 kHz as shown in *Figure 25*.

Figure 25. Start of frame, low data rate, one subcarrier

For the Fast commands, the SOF comprises an unmodulated time of 113.28 μ s, followed by 48 pulses at 423.75 kHz (f_{\odot} /32), and a logic 1 that includes an unmodulated time of 37.76 μ s followed by 16 pulses at 423.75 kHz as shown in *Figure 26*.

Figure 26. Start of frame, low data rate, one subcarrier x2

LRIS2K LRIS2K to VCD frames

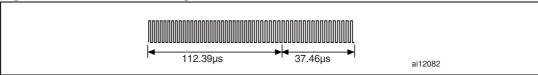

8.4 SOF when using two subcarriers

8.5 High data rate

The SOF comprises 27 pulses at 484.28 kHz ($f_{\text{c}}/28$), followed by 24 pulses at 423.75 kHz ($f_{\text{c}}/32$), and a logic 1 that includes 9 pulses at 484.28 kHz followed by 8 pulses at 423.75 kHz as shown in *Figure 27*.

For the Fast commands, the x2 mode is not available.

Figure 27. Start of frame, high data rate, two subcarriers

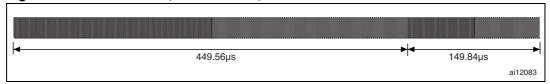

8.6 Low data rate

The SOF comprises 108 pulses at 484.28 kHz ($f_{\text{C}}/28$), followed by 96 pulses at 423.75 kHz ($f_{\text{C}}/32$), and a logic 1 that includes 36 pulses at 484.28 kHz followed by 32 pulses at 423.75 kHz as shown in *Figure 28*.

For the Fast commands, the x2 mode is not available.

Figure 28. Start of frame, low data rate, two subcarriers

LRIS2K to VCD frames LRIS2K

8.7 EOF when using one subcarrier

8.8 High data rate

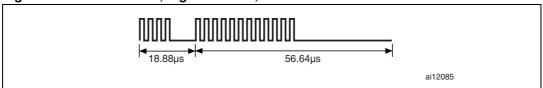

The EOF comprises a logic 0 that includes 8 pulses at 423.75 kHz and an unmodulated time of 18.88 μ s, followed by 24 pulses at 423.75 kHz ($f_O/32$), and by an unmodulated time of 56.64 μ s as shown in *Figure 29*.

Figure 29. End of frame, high data rate, one subcarriers

For the Fast commands, the EOF comprises a logic 0 that includes 4 pulses at 423.75 kHz and an unmodulated time of 9.44 μ s, followed by 12 pulses at 423.75 kHz ($f_C/32$) and an unmodulated time of 37.76 μ s as shown in *Figure 30*.

Figure 30. End of frame, high data rate, one subcarriers x2

8.9 Low data rate

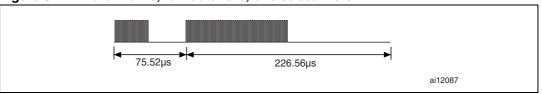

The EOF comprises a logic 0 that includes 32 pulses at 423.75 kHz and an unmodulated time of 75.52 μ s, followed by 96 pulses at 423.75 kHz ($f_{\text{C}}/32$) and an unmodulated time of 226.56 μ s as shown in *Figure 31*.

Figure 31. End of frame, low data rate, one subcarriers

For the Fast commands, the EOF comprises a logic 0 that includes 16 pulses at 423.75 kHz and an unmodulated time of 37.76 μ s, followed by 48 pulses at 423.75 kHz ($f_C/32$) and an unmodulated time of 113.28 μ s as shown in *Figure 32*.

LRIS2K LRIS2K to VCD frames

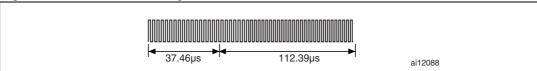

8.10 EOF when using two subcarriers

8.11 High data rate

The EOF comprises a logic 0 that includes 8 pulses at 423.75 kHz and 9 pulses at 484.28 kHz, followed by 24 pulses at 423.75 kHz ($f_{c}/32$) and 27 pulses at 484.28 kHz ($f_{c}/28$) as shown in *Figure 33*.

For the Fast commands, the x2 mode is not available.

Figure 33. End of frame, high data rate, two subcarriers

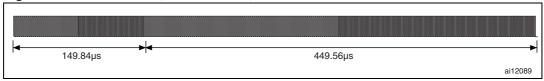

8.12 Low data rate

The EOF comprises a logic 0 that includes 32 pulses at 423.75 kHz and 36 pulses at 484.28 kHz, followed by 96 pulses at 423.75 kHz ($f_{\text{C}}/32$) and 108 pulses at 484.28 kHz ($f_{\text{C}}/28$) as shown in *Figure 34*.

For the Fast commands, the x2 mode is not available.

Figure 34. End of frame, low data rate, two subcarriers

9 Unique identifier (UID)

The LRIS2Ks are uniquely identified by a 64-bit Unique Identifier (UID). This UID complies with ISO/IEC 15963 and ISO/IEC 7816-6. The UID is a read-only code and comprises:

- 8 MSBs with a value of E0h
- The IC Manufacturer code of ST 02h, on 8 bits (ISO/IEC 7816-6/AM1)
- a Unique Serial Number on 48 bits

Table 11. UID format

MSB LSB

| 63 | 56 | 55 | 48 | 47 | 0 |
|----|------|------|----|----------------------|---|
| | 0xE0 | 0x02 | | Unique serial number | |

With the UID each LRIS2K can be addressed uniquely and individually during the anticollision loop and for one-to-one exchanges between a VCD and an LRIS2K.

Doc ID 13888 Rev 9

10 Application family identifier (AFI)

The AFI (application family identifier) represents the type of application targeted by the VCD and is used to identify, among all the LRIS2Ks present, only the LRIS2Ks that meet the required application criteria.

No AFI Flag
Set ?

Yes

AFI value
= 0 ?

Yes

AFI value
= Internal
value ?

Figure 35. LRIS2K decision tree for AFI

The AFI is programmed by the LRIS2K issuer (or purchaser) in the AFI register. Once programmed and Locked, it can no longer be modified.

Answer given by the LRIS2K

to the Inventory Request

The most significant nibble of the AFI is used to code one specific or all application families.

No Answer

AI13238

The least significant nibble of the AFI is used to code one specific or all application subfamilies. Subfamily codes different from 0 are proprietary.

(See ISO 15693-3 documentation)

11 Data storage format identifier (DSFID)

The data storage format identifier indicates how the data is structured in the LRIS2K memory. The logical organization of data can be known instantly using the DSFID.

It can be programmed and locked using the Write DSFID and Lock DSFID commands.

11.1 CRC

The CRC used in the LRIS2K is calculated as per the definition in ISO/IEC 13239.

The initial register contents are all ones: FFFFh.

The two-byte CRC are appended to each request and response, within each frame, before the EOF. The CRC is calculated on all the bytes after the SOF up to the CRC field.

Upon reception of a request from the VCD, the LRIS2K verifies that the CRC value is valid. If it is invalid, the LRIS2K discards the frame and does not answer to the VCD.

Upon reception of a request from the LRIS2K, it is recommended that the VCD verifies whether the CRC value is valid. If it is invalid, actions to be performed are left to the discretion of the VCD designer.

The CRC is transmitted least significant byte first.

Each byte is transmitted least significant bit first.

Table 12. CRC transmission rules

| | LSByte | | | MSByte | |
|-------|-----------------|-------|-------|-----------------|-------|
| LSBit | | MSBit | LSBit | | MSBit |
| | CRC 16 (8 bits) | | | CRC 16 (8 bits) | |

12 LRIS2K protocol description

The Transmission protocol (or simply protocol) defines the mechanism used to exchange instructions and data between the VCD and the LRIS2K, in both directions. It is based on the concept of "VCD talks first".

This means that an LRIS2K will not start transmitting unless it has received and properly decoded an instruction sent by the VCD. The protocol is based on an exchange of:

- a request from the VCD to the LRIS2K
- a response from the LRIS2K to the VCD

Each request and each request are contained in a frame. The frame delimiters (SOF, EOF) are described in *Section 8: LRIS2K to VCD frames*.

Each request consists of:

- a request SOF (see Figure 8 and Figure 9)
- flags
- a command code
- parameters, depending on the command
- application data
- a 2-byte CRC
- a request EOF (see Figure 10)

Each request consists of:

- an Answer SOF (see Figure 23 to Figure 28)
- flags
- parameters, depending on the command
- application data
- a 2-byte CRC
- an Answer EOF (see Figure 29 to Figure 34)

The protocol is bit-oriented. The number of bits transmitted in a frame is a multiple of eight (8), i.e. an integer number of bytes.

A single-byte field is transmitted least significant bit (LSBit) first. A multiple-byte field is transmitted least significant byte (LSByte) first, each byte is transmitted least significant bit (LSBit) first.

The setting of the flags indicates the presence of the optional fields. When the flag is set (to one), the field is present. When the flag is reset (to zero), the field is absent.

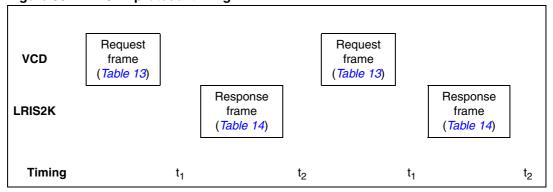

Table 13. VCD request frame format

| Request SOF Request_flags | Command code | Parameters | Data | 2-byte CRC | Request EOF |

Figure 36. LRIS2K protocol timing

LRIS2K LRIS2K states

13 LRIS2K states

An LRIS2K can be in one of 4 states:

- Power-off
- Ready
- Quiet
- Selected

Transitions between these states are specified in *Figure 37: LRIS2K state transition diagram* and *Table 15: LRIS2K response depending on Request_flags*.

13.1 Power-off state

The LRIS2K is in the Power-off state when it does not receive enough energy from the VCD.

13.2 Ready state

The LRIS2K is in the Ready state when it receives enough energy from the VCD. When in the Ready state, the LRIS2K answers any request where the Select_flag is not set.

13.3 Quiet state

When in the Quiet state, the LRIS2K answers any request except for Inventory requests with the Address_flag set.

13.4 Selected state

In the Selected state, the LRIS2K answers any request in all modes (see *Section 14: Modes*):

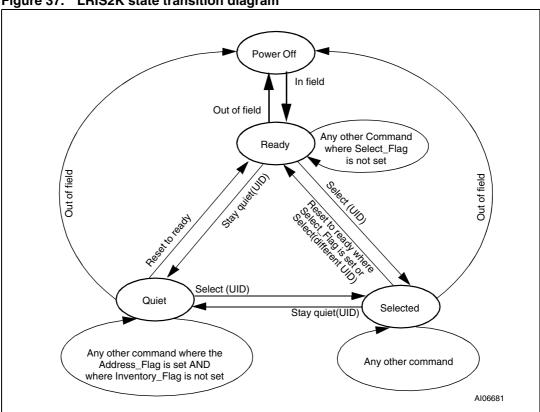

- request in Select mode with the Select_flag set
- request in Addressed mode if the UID matches
- request in Non-Addressed mode as it is the mode for general requests

LRIS2K states LRIS2K

Table 15. LRIS2K response depending on Request_flags

| | Addr | ess_flag | Select_flag | | |
|---|----------------|--------------------|---------------|-------------------|--|
| Flags | 1 Addressed | 0 Non addressed | 1 Selected | 0 Non selected | |
| LRIS2K in Ready or Selected state (Devices in Quiet state do not answer) | | Х | | х | |
| LRIS2K in Selected state | | Х | Х | | |
| LRIS2K in Ready, Quiet or Selected state (the device which matches the UID) | х | | | х | |
| Error (03h) | Х | | Х | | |

Figure 37. LRIS2K state transition diagram

The intention of the state transition method is that only one LRIS2K should be in the selected state at a time.

LRIS2K Modes

14 Modes

The term "mode" refers to the mechanism used in a request to specify the set of LRIS2Ks that will answer the request.

14.1 Addressed mode

When the Address_flag is set to 1 (Addressed mode), the request contains the Unique ID (UID) of the addressed LRIS2K.

Any LRIS2K that receives a request with the Address_flag set to 1 compares the received Unique ID to its own. If it matches, then the LRIS2K executes the request (if possible) and returns a request to the VCD as specified in the command description.

If the UID does not match, then it remains silent.

14.2 Non-addressed mode (general request)

When the Address_flag is cleared to 0 (Non-Addressed mode), the request does not contain a Unique ID. Any LRIS2K receiving a request with the Address_flag cleared to 0 executes it and returns a request to the VCD as specified in the command description.

14.3 Select mode

When the Select_flag is set to 1 (Select mode), the request does not contain an LRIS2K Unique ID. The LRIS2K in the Selected state that receives a request with the Select_flag set to 1 executes it and returns a request to the VCD as specified in the command description.

Only LRIS2Ks in the Selected state answer a request where the Select_flag set to 1.

The system design ensures in theory that only one LRIS2K can be in the Select state at a time.

Request format LRIS2K

15 Request format

The request consists of:

- an SOF
- flags
- a command code
- parameters and data
- a CRC
- an EOF

Table 16. General request format

| Request_flags | Parameters | Data | CRC | E O F |
|---------------|------------|------|-----|-------------|
|---------------|------------|------|-----|-------------|

15.1 Request_flags

In a request, the "flags" field specifies the actions to be performed by the LRIS2K and whether corresponding fields are present or not.

The flag field consists of eight bits.

The bit 3 (Inventory_flag) of the request_flag defines the contents of the 4 MSBs (bits 5 to 8).

When bit 3 is reset (0), bits 5 to 8 define the LRIS2K selection criteria.

When bit 3 is set (1), bits 5 to 8 define the LRIS2K Inventory parameters.

Table 17. Definition of request_flags 1 to 4

| Bit No | Flag | Level | Description |
|---------------------|-------------------------------------|---------------------------------------|---|
| Bit 1 | Subcarrier_flag ⁽¹⁾ | 0 | A single subcarrier frequency is used by the LRIS2K |
| Bit i Subcamer_liag | 1 | Two subcarrier are used by the LRIS2K | |
| Dit 0 | Bit 2 Data_rate_flag ⁽²⁾ | 0 | Low data rate is used |
| DIL Z | | 1 | High data rate is used |
| Bit 3 | 3 Inventory_flag | 0 | The meaning of flags 5 to 8 is described in <i>Table 18</i> |
| טונ ט | | 1 | The meaning of flags 5 to 8 is described in <i>Table 19</i> |
| Bit 4 | Protocol Extension_flag | 0 | No Protocol format extension |

^{1.} Subcarrier_flag refers to the LRIS2K-to-VCD communication.

^{2.} Data_rate_flag refers to the LRIS2K-to-VCD communication

LRIS2K Request format

Table 18. Request_flags 5 to 8 when Bit 3 = 0

| Bit No | Flag | Level | Description |
|--------|----------------------------------|--|--|
| Bit 5 | Bit 5 Select_flag ⁽¹⁾ | | Request is executed by any LRIS2K according to the setting of Address_flag |
| | 1 | Request is executed only by the LRIS2K in Selected state | |
| | | 0 | Request is not addressed. UID field is not present. The request is executed by all LRIS2Ks. |
| Bit 6 | Address_flag ⁽¹⁾ | 1 | Request is addressed. UID field is present. The request is executed only by the LRIS2K whose UID matches the UID specified in the request. |
| Bit 7 | Option_flag | 0 | |
| Bit 8 | RFU | 0 | |

^{1.} If the Select_flag is set to 1, the Address_flag is set to 0 and the UID field is not present in the request.

Table 19. Request_flags 5 to 8 when Bit 3 = 1

| Bit No | Flag | Level | Description |
|---------------------|--------------------|----------------------|--------------------------|
| Bit 5 | E AEL floor | | AFI field is not present |
| Bit 5 AFI_flag | 1 | AFI field is present | |
| Bit 6 | it C Nh alata flag | 0 | 16 slots |
| Bit 6 Nb_slots_flag | | 1 | 1 slot |
| Bit 7 | Option_flag | 0 | |
| Bit 8 | RFU | 0 | |

Response format LRIS2K

16 Response format

The request consists of:

- an SOF
- flags
- parameters and data
- a CRC
- an EOF

Table 20. General response format

| S O Response_F | flags Parameters | Data | CRC | н О н | |
|----------------|------------------|------|-----|-------|--|
|----------------|------------------|------|-----|-------|--|

16.1 Response_flags

In a request, the flags indicate how actions have been performed by the LRIS2K and whether corresponding fields are present or not. The request_flags consist of eight bits.

Table 21. Definitions of response_flags 1 to 8

| Bit No | Flag | Level | Description |
|--------|------------------|-------|---|
| Dit 1 | Bit 1 Error_flag | 0 | No error |
| Dit i | | 1 | Error detected. Error code is in the "Error" field. |
| Bit 2 | RFU | 0 | |
| Bit 3 | RFU | 0 | |
| Bit 4 | Extension_flag | 0 | No extension |
| Bit 5 | RFU | 0 | |
| Bit 6 | RFU | 0 | |
| Bit 7 | RFU | 0 | |
| Bit 8 | RFU | 0 | |

LRIS2K Response format

16.2 Response error code

If the Error_flag is set by the LRIS2K in the request, the Error code field is present and provides information about the error that occurred.

Error codes not specified in *Table 22* are reserved for future use.

Table 22. Response error code definition

| Error code | Meaning | | | | |
|------------|---|--|--|--|--|
| 03h | The option is not supported | | | | |
| 0Fh | Error with no information given | | | | |
| 10h | The specified block is not available | | | | |
| 11h | The specified block is already locked and thus cannot be locked again | | | | |
| 12h | The specified block is locked and its contents cannot be changed. | | | | |
| 13h | The specified block was not successfully programmed | | | | |
| 14h | The specified block was not successfully locked | | | | |

Anticollision LRIS2K

17 Anticollision

The purpose of the anticollision sequence is to inventory the LRIS2Ks present in the VCD field using their unique ID (UID).

The VCD is the master of communications with one or several LRIS2Ks. It initiates LRIS2K communication by issuing the Inventory request.

The LRIS2K sends its request in the determined slot or does not respond.

17.1 Request parameters

When issuing the Inventory command, the VCD:

- sets the Nb_slots_flag as desired
- adds the mask length and the mask value after the command field
- The mask length is the number of significant bits of the mask value.
- The mask value is contained in an integer number of bytes. The mask length indicates the number of significant bits. LSB is transmitted first
- If the mask length is not a multiple of 8 (bits), as many 0-bits as required will be added to the mask value MSB so that the mask value is contained in an integer number of bytes
- The next field starts at the next byte boundary.

Table 23. Inventory request format

MSB

| SOF | Request_ flags | Command | Optional AFI | Mask length | Mask value | CRC | EOF |
|-----|-------------------|---------|-----------------|----------------|--------------|---------|-----|
| | 8 bits | 8 bits | 8 bits | 8 bits | 0 to 8 bytes | 16 bits | |

In the example of the *Table 24* and *Figure 38*, the mask length is 11 bits. Five 0-bits are added to the mask value MSB. The 11-bit Mask and the current slot number are compared to the UID.

Table 24. Example of the addition of 0-bits to an 11-bit mask value

| (b ₁₅) MSB | LSB (b ₀) |
|------------------------|-----------------------|
| 0000 0 | 100 1100 1111 |
| 0-bits added | 11-bit mask value |

LRIS2K Anticollision

MSB 0000 0100 1100 1111 Mask value received in the Inventory command 16 bits The Mask value less the padding 0s is loaded 100 1100 1111 11 bits into the Tag comparator MSBLSB The Slot counter is calculated Nb_slots_flags = 0 (16 slots), Slot Counter is 4 bits XXXX 4 bits The Slot counter is concatened to the Mask value xxxx 100 1100 1111 $Nb_slots_flags = 0$ 15 bits UID b63 The concatenated result is compared with 64 bits b the least significant bits of the Tag UID. Bits ignored Compare AI06682

Figure 38. Principle of comparison between the mask, the slot number and the UID

The AFI field is present if the AFI_flag is set.

The pulse is generated according to the definition of the EOF in ISO/IEC 15693-2.

The first slot starts immediately after the reception of the request EOF. To switch to the next slot, the VCD sends an EOF.

The following rules and restrictions apply:

- if no LRIS2K answer is detected, the VCD may switch to the next slot by sending an EOF,
- if one or more LRIS2K answers are detected, the VCD waits until the complete frame has been received before sending an EOF for switching to the next slot.

18 Request processing by the LRIS2K

Upon reception of a valid request, the LRIS2K performs the following algorithm:

- NbS is the total number of slots (1 or 16)
- SN is the current slot number (0 to 15)
- LSB (value, n) function returns the n Less Significant Bits of value
- MSB (value, n) function returns the n Most Significant Bits of value
- "&" is the concatenation operator
- Slot_frame is either an SOF or an EOF

```
SN = 0
if (Nb_slots_flag)
  then NbS = 1
       SN length = 0
       endif
  else NbS = 16
       SN length = 4
       endif
label1:
if LSB(UID, SN length + Mask length) =
 LSB(SN, SN length) &LSB(Mask, Mask length)
  then answer to inventory request
       endif
wait (Slot frame)
if Slot frame = SOF
  then Stop Anticollision
       decode/process request
       exit
       endif
if Slot frame = EOF
  if SN < NbS-1
     then SN = SN + 1
         goto label1
         exit
         endif
  endif
```

19 Explanation of the possible cases

Figure 39 summarizes the main possible cases that can occur during an anticollision sequence when the slot number is 16.

The different steps are:

- The VCD sends an Inventory request, in a frame terminated by an EOF. The number of slots is 16
- LRIS2K 1 transmits its request in Slot 0. It is the only one to do so, therefore no collision occurs and its UID is received and registered by the VCD;
- The VCD sends an EOF in order to switch to the next slot.
- In slot 1, two LRIS2Ks, LRIS2K 2 and LRIS2K 3 transmit a request, thus generating a collision. The VCD records the event and remembers that a collision was detected in Slot 1.
- The VCD sends an EOF in order to switch to the next slot.
- In Slot 2, no LRIS2K transmits a request. Therefore the VCD does not detect any LRIS2K SOF and decides to switch to the next slot by sending an EOF.
- In slot 3, there is another collision caused by requests from LRIS2K 4 and LRIS2K 5
- The VCD then decides to send a request (for instance a Read Block) to LRIS2K 1 whose UID has already been correctly received.
- All LRIS2Ks detect an SOF and exit the anticollision sequence. They process this
 request and since the request is addressed to LRIS2K 1, only LRIS2K 1 transmits a
 request.
- All LRIS2Ks are ready to receive another request. If it is an Inventory command, the slot numbering sequence restarts from 0.

Note:

The decision to interrupt the anticollision sequence is made by the VCD. It could have continued to send EOFs until Slot 16 and only then sent the request to LRIS2K 1.

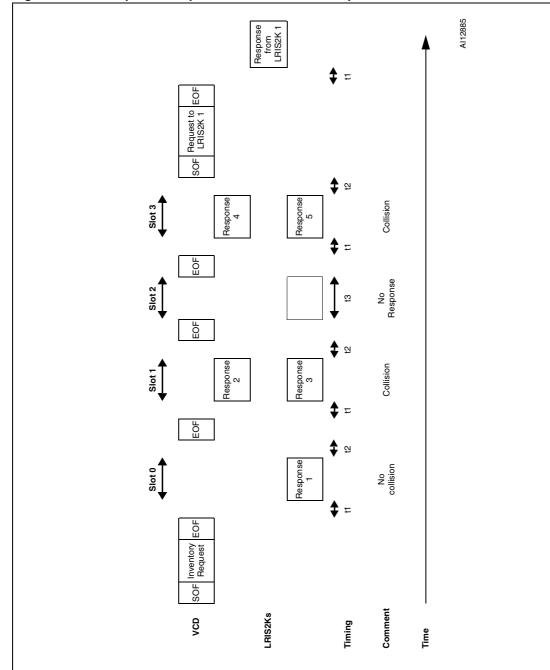

Figure 39. Description of a possible anticollision sequence

20 Inventory Initiated command

The LRIS2K provides a special feature to improve the inventory time response of moving tags using the Initiate_flag value. This flag, controlled by the Initiate command, allows tags to answer to Inventory Initiated commands.

For applications in which multiple tags are moving in front of a reader, it is possible to miss tags using the standard inventory command. The reason is that the inventory sequence has to be performed on a global tree search. For example, a tag with a particular UID value may have to wait the run of a long tree search before being inventoried. If the delay is too long, the tag may be out of the field before it has been detected.

Using the Initiate command, the inventory sequence is optimized. When multiple tags are moving in front of a reader, the ones which are within the reader field will be initiated by the Initiate command. In this case, a small batch of tags will answer to the Inventory Initiated command which will optimize the time necessary to identify all the tags. When finished, the reader has to issue a new Initiate command in order to initiate a new small batch of tags which are new inside the reader field.

It is also possible to reduce the inventory sequence time using the Fast Initiate and Fast Inventory Initiated commands. These commands allow the LRIS2Ks to increase their response data rate by a factor of 2, up to 53kbit/s.

Timing definition LRIS2K

21 Timing definition

21.1 t₁: LRIS2K response delay

Upon detection of the rising edge of the EOF received from the VCD, the LRIS2K waits for a time t_{1nom} before transmitting its response to a VCD request or before switching to the next slot during an inventory process. Values of t_1 are given in *Table 25*. The EOF is defined in *Figure 10 on page 24*.

21.2 t₂: VCD new request delay

 t_2 is the time after which the VCD may send an EOF to switch to the next slot when one or more LRIS2K responses have been received during an Inventory command. It starts from the reception of the EOF from the LRIS2Ks.

The EOF sent by the VCD may be either 10% or 100% modulated regardless of the modulation index used for transmitting the VCD request to the LRIS2K.

 t_2 is also the time after which the VCD may send a new request to the LRIS2K as described in *Figure 36: LRIS2K protocol timing*.

Values of t2 are given in Table 25.

21.3 t₃: VCD new request delay in the absence of a response from the LRIS2K

 t_3 is the time after which the VCD may send an EOF to switch to the next slot when no LRIS2K response has been received.

The EOF sent by the VCD may be either 10% or 100% modulated regardless of the modulation index used for transmitting the VCD request to the LRIS2K.

From the time the VCD has generated the rising edge of an EOF:

- If this EOF is 100% modulated, the VCD waits a time at least equal to t_{3min} before sending a new EOF.
- If this EOF is 10% modulated, the VCD waits a time at least equal to the sum of t_{3min} + the LRIS2K nominal response time (which depends on the LRIS2K data rate and subcarrier modulation mode) before sending a new EOF.

Table 25. Timing values⁽¹⁾

| | Minimum (min) values | Nominal (nom) values | Maximum (max) values |
|----------------|----------------------------------|----------------------|----------------------|
| t ₁ | 318.6 μs | 320.9 µs | 323.3 µs |
| t ₂ | 309.2 μs | No t _{nom} | No t _{max} |
| t ₃ | $t_{1max}^{(2)} + t_{SOF}^{(3)}$ | No t _{nom} | No t _{max} |

^{1.} The tolerance of specific timings is $\pm 32/f_{\rm C}$.

^{2.} t_{1max} does not apply for write alike requests. Timing conditions for write alike requests are defined in the command description.

t_{SOF} is the time taken by the LRIS2K to transmit an SOF to the VCD. t_{SOF} depends on the current data rate: High data rate or Low data rate.

LRIS2K Commands codes

22 Commands codes

The LRIS2K supports the commands described in this section. Their codes are given in *Table 26*.

Table 26. Command codes

| Command code standard | Function | | | |
|-----------------------|---------------------------------------|--|--|--|
| 01h | Inventory | | | |
| 02h | Stay Quiet | | | |
| 20h | Read Single Block | | | |
| 21h | Write Single Block | | | |
| 22h | Lock Block | | | |
| 25h | Select | | | |
| 26h | Reset to Ready | | | |
| 27h | Write AFI | | | |
| 28h | Lock AFI | | | |
| 29h | Write DSFID | | | |
| 2Ah | Lock DSFID | | | |
| 2Bh | Get System Info | | | |
| 2Ch | Get Multiple Block Security Status | | | |

| Command code custom | Function |
|---------------------|--------------------------|
| A6h | Kill |
| B1h | Write password |
| B2h | Lock Password |
| B3h | Present Password |
| C0h | Fast Read Single Block |
| C1h | Fast Inventory Initiated |
| C2h | Fast Initiate |
| D1h | Inventory Initiated |
| D2h | Initiate |
| | |
| | |
| | |
| | |
| | |

Inventory LRIS2K

23 Inventory

When receiving the Inventory request, the LRIS2K runs the anticollision sequence. The Inventory_flag is set to 1. The meaning of flags 5 to 8 is shown in *Table 19: Request_flags 5* to 8 when Bit 3 = 1.

The request contains the:

- flags
- Inventory command code (see Table 26: Command codes)
- AFI if the AFI flag is set
- mask length
- mask value
- CRC

The LRIS2K does not generate any answer in case of error.

Table 27. Inventory request format

| Request SOF | Request_flags | Inventory | Optional AFI | Mask length | Mask value | CRC16 | Request EOF |
|----------------|---------------|-----------|-----------------|----------------|---------------|---------|----------------|
| | 8 bits | 01h | 8 bits | 8 bits | 0 - 64 bits | 16 bits | |

The response contains the:

- flags
- unique ID

Table 28. Inventory response format

| Response SOF | Response_ flags | DSFID | UID | CRC16 | Response EOF |
|-----------------|--------------------|--------|---------|---------|-----------------|
| | 8 bits | 8 bits | 64 bits | 16 bits | |

During an Inventory process, if the VCD does not receive an RF LRIS2K response, it waits a time t_3 before sending an EOF to switch to the next slot. t_3 starts from the rising edge of the request EOF sent by the VCD.

- If the VCD sends a 100% modulated EOF, the minimum value of t_3 is: t_3 min = 4384/f_C (323.3µs) + t_{SOF}
- If the VCD sends a 10% modulated EOF, the minimum value of t_3 is: t_3 min = 4384/ t_C (323.3 μ s) + t_{NRT}

where:

- t_{SOF} is the time required by the LRIS2K to transmit an SOF to the VCD
- t_{NRT} is the nominal response time of the LRIS2K

 $t_{\mbox{NRT}}$ and $t_{\mbox{SOF}}$ are dependent on the LRIS2K-to-VCD data rate and subcarrier modulation mode.

LRIS2K Stay Quiet

24 Stay Quiet

Command code = 0x02

On receiving the Stay Quiet command, the LRIS2K enters the Quiet state and does NOT send back a request. There is NO response to the Stay Quiet command even if an error occurs.

When in the Quiet state:

- the LRIS2K does not process any request if the Inventory_flag is set,
- the LRIS2K processes any Addressed request

The LRIS2K exits the Quiet state when:

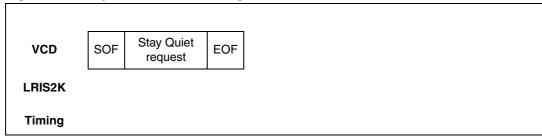

- it is reset (power off),
- receiving a Select request. It then goes to the Selected state,
- receiving a Reset to Ready request. It then goes to the Ready state.

Table 29. Stay Quiet request format

| Request SOF | Request_flags | Stay Quiet | UID | CRC16 | Request EOF |
|----------------|---------------|------------|---------|---------|----------------|
| | 8 bits | 02h | 64 bits | 16 bits | |

The Stay Quiet command must always be executed in Addressed mode (Select_flag is reset to 0 and Address_flag is set to 1).

Figure 40. Stay Quiet frame exchange between VCD and LRIS2K

Read Single Block LRIS2K

25 Read Single Block

On receiving the Read Single Block command, the LRIS2K reads the requested block and sends back its 32 bits value in the request. The Option_flag is supported and gives access to the protect status.

Table 30. Read Single Block request format

| Request SOF | Request_flags | Read Single Block | UID | Block number | CRC16 | Request EOF |
|----------------|---------------|----------------------|---------|-----------------|---------|----------------|
| | 8 bits | 20h | 64 bits | 8 bits | 16 bits | |

Request parameters:

- Option_flag
- UID (optional)
- Block number

Table 31. Read Single Block response format when Error_flag is NOT set

| Response SOF | Response_flags | Block locking status | Data | CRC16 | Response EOF |
|-----------------|----------------|----------------------|---------|---------|-----------------|
| | 8 bits | | 32 bits | 16 bits | |

Response parameters:

OFh: other error

- 10h: block address not available

LRIS2K Read Single Block

Figure 41. Read Single Block frame exchange between VCD and LRIS2K

Write Single Block LRIS2K

26 Write Single Block

On receiving the Write Single Block command, the LRIS2K writes the data contained in the request to the requested block and reports whether the write operation was successful in the request. The Option_flag is supported.

During the write cycle t_W , there should be no modulation (neither 100% nor 10%). Otherwise, the LRIS2K may not program correctly the data into the memory. The t_W time is equal to $t_{1nom}+18\times302~\mu s$.

Table 34. Write Single Block request format

| Request SOF | Request_ flags | Write Single Block | UID | Block number | Data | CRC16 | Request EOF |
|----------------|-------------------|--------------------------|---------|-----------------|---------|---------|----------------|
| | 8 bits | 21h | 64 bits | 8 bits | 32 bits | 16 bits | |

Request parameters:

- UID (optional)
- Block number
- Data

Table 35. Write Single Block response format when Error_flag is NOT set

| Response SOF | Response_flags | CRC16 | Response EOF |
|--------------|----------------|---------|--------------|
| | 8 bits | 16 bits | |

Response parameter:

No parameter. The response is send back after the writing cycle.

Table 36. Write Single Block response format when Error_flag is set

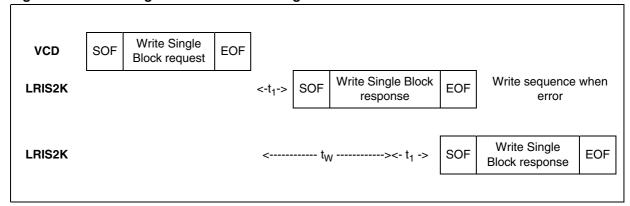

| Response SOF | Response_ Flags | Error code | CRC16 | Response EOF |
|-----------------|--------------------|------------|---------|-----------------|
| | 8 bits | 8 bits | 16 bits | |

Response parameter:

- Error code as Error_flag is set:
 - 10h: block address not available
 - 12h: block is locked
 - 13h: block not programmed

LRIS2K Write Single Block

Figure 42. Write Single Block frame exchange between VCD and LRIS2K

Lock Block LRIS2K

27 Lock Block

On receiving the Lock Block command, the LRIS2K permanently locks the selected block.

During the write cycle t_W , there should be no modulation (neither 100% nor 10%). Otherwise, the LRIS2K may not lock correctly the memory block. The t_W time is equal to t_{1nom} + 18 × 302 μ s.

Table 37. Lock Single Block request format

| Request SOF | Request_ flags | Lock Block | UID | Block number | CRC16 | Request EOF |
|----------------|-------------------|---------------|---------|-----------------|---------|----------------|
| | 8 bits | 22h | 64 bits | 8 bits | 16 bits | |

Request parameters:

- (Optional) UID
- Block number

Table 38. Lock Block response format when Error_flag is NOT set

| Response SOF | Response_flags | CRC16 | Response EOF |
|-----------------|----------------|---------|-----------------|

10h: block address not available

11h: block is locked

14h: block not locked

LRIS2K Lock Block

Figure 43. Lock Block frame exchange between VCD and LRIS2K

Select LRIS2K

28 Select

When receiving the Select command:

• if the UID is equal to its own UID, the LRIS2K enters or stays in the Selected state and sends a request.

 if the UID does not match its own, the selected LRIS2K returns to the Ready state and does not send a request.

The LRIS2K answers an error code only if the UID is equal to its own UID. If not, no response is generated.

Table 40. Select request format

| Request SOF | Request_ flags | Select | UID | CRC16 | Request EOF |
|----------------|-------------------|--------|---------|---------|----------------|
| | 8 bits | 25h | 64 bits | 16 bits | |

Request parameter:

UID

| | 8 bits | 8 bits | 16 bits | |

Response parameter:

- Error code as Error_flag is set:
 - 0Fh: other error

Figure 45. Reset to Ready frame exchange between VCD and LRIS2K

Write AFI LRIS2K

30 Write AFI

On receiving the Write AFI request, the LRIS2K writes the AFI byte value into its memory.

During the write cycle t_W , there should be no modulation (neither 100% nor 10%). Otherwise, the LRIS2K may not write correctly the AFI value into the memory. The t_W time is equal to $t_{1nom}+18\times302~\mu s$.

Table 46. Write AFI request format

| Request SOF | Request _flags | Write AFI | UID | AFI | CRC16 | Request EOF |
|----------------|-------------------|--------------|---------|--------|---------|----------------|

 - 14h: block not locked

Figure 47. Lock AFI frame exchange between VCD and LRIS2K

LRIS2K Write DSFID

32 Write DSFID

On receiving the Write DSFID request, the LRIS2K writes the DSFID byte value into its memory.

During the write cycle t_W , there should be no modulation (neither 100% nor 10%). Otherwise, the LRIS2K may not write correctly the DSFID value in memory. The t_W time is equal to $t_{1nom}+18\times302~\mu s$.

Table 52. Write DSFID request format

| Request SOF | Request_ flags | Write DSFID | UID | DSFID | CRC16 | Request EOF |

 - 13h: block not programmed

Write DSFID LRIS2K

Figure 48. Write DSFID frame exchange between VCD and LRIS2K

LRIS2K Lock DSFID

33 Lock DSFID

On receiving the Lock DSFID request, the LRIS2K locks the DSFID value permanently.

During the write cycle t_W , there should be no modulation (neither 100% nor 10%). Otherwise, the LRIS2K may not lock correctly the DSFID value in memory. The t_W time is equal to $t_{1nom}+18\times302~\mu s$.

Get System Info LRIS2K

34 Get System Info

When receiving the Get System Info command, the LRIS2K sends back its information data in the request. The Option_flag is supported and must be reset to 0. The Get System Info can be issued in both Addressed and Non Addressed modes.

Table 58. Get System Info request format

| Request SOF | Request _flags | Get System Info | UID | CRC16 | Request EOF |
|----------------|-------------------|--------------------|---------|---------|----------------|
| | 8 bits | 2Bh | 64 bits | 16 bits | |

Request parameter:

UID (optional)

Table 59. Get System Info response format when Error_flag is NOT set

| Response SOF | Response _flags | Information _flags | UID | DSFID | AFI | Memory Size | IC reference | CRC16 | Response EOF |

Response parameter:

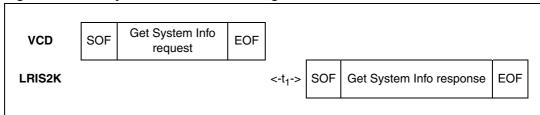

Error code as Error_flag is set:

03h: Option not supported

- 0Fh: other error

LRIS2K Get System Info

Figure 50. Get System Info frame exchange between VCD and LRIS2K

35 Get Multiple Block Security Status

When receiving the Get Multiple Block Security Status command, the LRIS2K sends back the block security status. The blocks are numbered from '00 to '3F' in the request and the value is minus one (-1) in the field. For example, a value of '06' in the "Number of blocks" field requests to return the security status of 7 blocks. In request, option flag must be set to 0.

Table 61. Get Multiple Block Security Status request format

| Request SOF | Request _flags | Get Multiple Block Security Status | UID | First block number | Number of blocks | CRC16 | Request EOF |
|----------------|-------------------|--|---------|--------------------------|------------------------|---------|----------------|
| | 8 bits | 2Ch | 64 bits | 8 bits | 8 bits | 16 bits | |

Request parameters:

- UID (optional)
- First block number
- Number of blocks

Table 62. Get Multiple Block Security Status response format when Error_flag is NOT set

 - OFh: other error

Figure 51. Get Multiple Block Security Status frame exchange between VCD and LRIS2K

Kill LRIS2K

36 Kill

On receiving the Kill command, in the Addressed mode only, the LRIS2K compares the kill code with the data contained in the request and reports whether the operation was successful in the request. If the command is received in the Non Addressed or the Selected mode, the LRIS2K returns an error response.

During the comparison cycle equal to t_W , there should be no modulation (neither 100% nor 10%). Otherwise, the LRIS2K may not match the kill code correctly. The t_W time is equal to t_{1nom} + 18 × 302 μ s. After a successful Kill command, the LRIS2K is deactivated and does not interpret any other command.

Table 65. Kill request format

| Request SOF | Request _flags | Kill | IC MFG Code | UID | Kill access | Kill code | CRC16 | Request EOF |
|----------------|-------------------|------|-------------------|---------|----------------|-----------|--------|----------------|
| | 8 bits | A6h | 0x02 | 64 bits | 00h | 32 bits | 16bits | |

Request parameters:

- UID
- Kill code

Table 66. Kill response format when Error_flag is NOT set

| Response SOF | Response_flags | CRC16 | Response EOF |
|-----------------|----------------|---------|-----------------|
| | 8 bits | 16 bits | |

Response parameter:

• No parameter. The response is send back after the writing cycle

Table 67. Kill response format when Error_flag is set

| Response SOF | Response_ Flags | Error code | CRC16 | Response EOF |
|-----------------|--------------------|------------|---------|-----------------|

Response parameter:

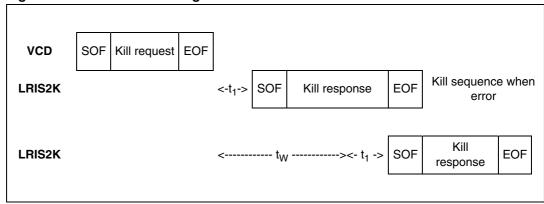

Error code as Error_flag is set:

OFh: other error

14h: LRIS2K not killed

LRIS2K Kill

Figure 52. Kill frame exchange between VCD and LRIS2K

Write Password LRIS2K

37 Write Password

On receiving the Write Password command, the LRIS2K uses the data contained in the request to write the password and reports whether the operation was successful in the request. The Option_flag is supported.

During the write cycle time, t_W , there must be no modulation at all (neither 100% nor 10%). Otherwise, the LRIS2K may not correctly program the data into the memory. The t_W time is equal to $t_{1nom} + 18 \times 302~\mu s$. After a successful write, the selected password must be locked again by issuing a Lock Password command to re-activate the block protection.

Prior to writing the password for a block, the Write Password command erases the Protect Status area of the block.

Table 68. Write Password request format

| Request SOF | Request _flags | Write Password | IC MFG code | UID | Password number | Data | CRC16 | Request EOF |
|----------------|-------------------|-------------------|-------------------|---------|--------------------|---------|---------|----------------|
| | 8 bits | B1h | 02h | 64 bits | 8 bits | 32 bits | 16 bits | |

Request parameters:

- UID (optional)
- Password number (00h = Kill, 01h = Pswd1, 02h = Pswd2, 03h = Pswd3, other = Error)
- Data

Table 69. Write Password response format when Error_flag is NOT set

| Response SOF | Response_flags | CRC16 | Response EOF |
|-----------------|----------------|---------|-----------------|
| | 8 bits | 16 bits | |

Response parameter:

• 32-bit password value. The response is sent back after the write cycle.

Table 70. Write Password response format when Error_flag is set

| Response | Response_ | | CRC16 | Response |
|----------|------------------|--------|---------|----------|
| SOF | Flags Error code | | | EOF |
| | 8 bits | 8 bits | 16 bits | |

Response parameter:

Error code as Error_flag is set:

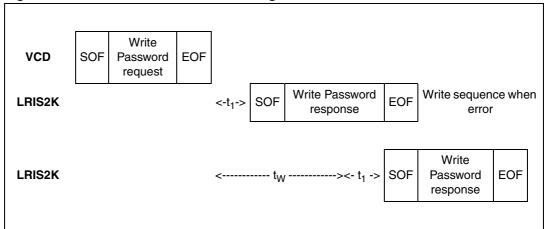

10h: block address not available

12h: block is locked

13h: block not programmed

LRIS2K Write Password

Figure 53. Write Password frame exchange between VCD and LRIS2K

Lock Password LRIS2K

38 Lock Password

On receiving the Lock Password command, the LRIS2K sets the access rights and permanently locks the selected block. The Option_flag is supported.

RFU bit 8 of the request_flag is used to select either the memory area (bit 8 = '0') or the password area (bit 8 = '1').

During the write cycle t_W , there should be no modulation (neither 100% nor 10%) otherwise, the LRIS2K may not correctly lock the memory block.

The t_W time is equal to t_{1nom} + 18 \times 302 $\mu s.$

Table 71. Lock Password request format

| Request SOF | Request _flags | Lock Password | IC MFG code | UID | Block number | Protect Status | CRC16 | Request EOF |
|----------------|-------------------|------------------|-------------------|---------|-----------------|-------------------|---------|----------------|
| | 8 bits | B2h | 02h | 64 bits | 8 bits | 8 bits | 16 bits | |

Request parameters:

- (Optional) UID
- Block number (bit 8 = '1': 00h = Kill, 01h = Pswd1, 02h = Pswd2, 03h = Pswd3, other = Error)
- Protect status (refer to Table 72)

Table 72. Protect status

|-----------------|--------------------|------------|---------|-----------------|
| | 8 bits | 8 bits | 16 bits | |

LRIS2K Lock Password

Response parameter:

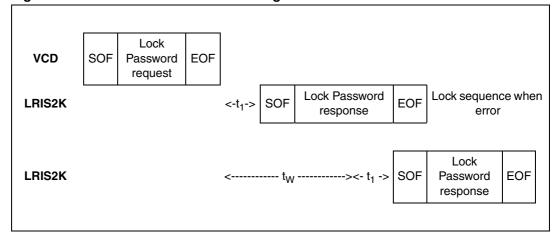

• Error code as Error_flag is set:

- 10h: block address not available

11h: block is locked

14: block not locked

Figure 54. Lock Password frame exchange between VCD and LRIS2K

Present Password LRIS2K

39 Present Password

On receiving the Present Password command, the LRIS2K compares the requested password with the data contained in the request and reports whether the operation has been successful in the request. The Option_flag is supported.

During the comparison cycle equal to t_W , there should be no modulation (neither 100% nor 10%) otherwise, the LRIS2K the Password value may not be correctly compared.

The t_W time is equal to t_{1nom} + 18 × 302 μ s.

After a successful command, the access to all the memory blocks linked to the password is changed as described in *Section 2: LRIS2K block security*.

Table 75. Present Password request format

| Request SOF | | Present Password | | UID | Password number | Data | CRC16 | Request EOF |
|----------------|--------|---------------------|-----|---------|--------------------|---------|---------|----------------|
| | 8 bits | B3h | 02h | 64 bits | 8 bits | 32 bits | 16 bits | |

Request parameters:

- UID (optional)
- Password number (0x01 = Pswd1, 0x02 = Pswd2, 0x03 = Pswd3, other = Error)
- Data

Table 76. Present Password response format when Error_flag is NOT set

 - 10h: block address not available

Figure 56. Fast Read Single Block frame exchange between VCD and LRIS2K

41 Fast Inventory Initiated

Before receiving the Fast Inventory Initiated command, the LRIS2K must have received an Initiate or a Fast Initiate command in order to set the Initiate_ flag. If not, the LRIS2K does not answer to the Fast Inventory Initiated command.

On receiving the Fast Inventory Initiated request, the LRIS2K runs the anticollision sequence. The Inventory_flag must be set to 1. The meaning of flags 5 to 8 is shown in *Table 19: Request_flags 5 to 8 when Bit 3 = 1*. The data rate of the response is multiplied by 2.

The request contains the:

- flags
- Inventory command code
- AFI option not supported, AFI_flag must be set to 0
- mask length
- mask value
- CRC

The LRIS2K does not generate any answer in case of error.

Table 82. Fast Inventory Initiated request format

| Request SOF | Request Flags | Fast Inventory Initiated | IC MFG code | Optional AFI | Mask length | Mask value | CRC16 | Request EOF |
|----------------|------------------|-----------------------------|----------------|-----------------|----------------|-------------|---------|----------------|
| | 8 bits | C1h | 02h | 8 bits | 8 bits | 0 - 64 bits | 16 bits | |

The response contains:

- the flags
- the Unique ID

Table 83. Fast Inventory Initiated response format

| Response SOF | Response_flags | DSFID | UID | CRC16 | Response EOF |
|--------------|----------------|-------|---------|---------|--------------|
| | 8 bits | 00h | 64 bits | 16 bits | |

During an Inventory process, if the VCD does not receive an RF LRIS2K response, it waits a time t_3 before sending an EOF to switch to the next slot. t_3 starts from the rising edge of the request EOF sent by the VCD.

- If the VCD sends a 100% modulated EOF, the minimum value of t_3 is: t_3 min = 4384/f_C (323.3µs) + t_{SOF}
- If the VCD sends a 10% modulated EOF, the minimum value of t_3 is: t_3 min = 4384/ t_C (323.3 μ s) + t_{NRT}

where:

- t_{SOF} is the time required by the LRIS2K to transmit an SOF to the VCD
- t_{NRT} is the nominal response time of the LRIS2K

 $t_{\mbox{\footnotesize{NRT}}}$ and $t_{\mbox{\footnotesize{SOF}}}$ are dependent on the LRIS2K-to-VCD data rate and subcarrier modulation mode.

LRIS2K Fast Initiate

42 Fast Initiate

On receiving the Fast Initiate command, the LRIS2K sets the internal Initiate_flag and sends back a request. The command has to be issued in the Non Addressed mode only (Select_flag is reset to 0 and Address_flag is reset to 0). If an error occurs, the LRIS2K does not generate any answer. The Initiate_flag is reset after a power off of the LRIS2K. The data rate of the response is multiplied by 2.

The request contains:

No data

Table 84. Fast Initiate request format

| Request SOF | Request_flags | Fast Initiate | IC MFG code | CRC16 | Request EOF |
|----------------|---------------|------------------|----------------|---------|----------------|
| | 8 bits | C2h | 02h | 16 bits | |

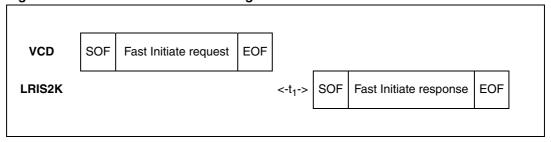

The response contains:

- the flags
- the Unique ID

| Response SOF | Response _flags | DSFID | UID | CRC16 | Response EOF |
|-----------------|--------------------|-------|---------|---------|-----------------|
| | 8 bits | 00h | 64 bits | 16 bits | |

Figure 57. Fast Initiate frame exchange between VCD and LRIS2K

Inventory Initiated LRIS2K

43 Inventory Initiated

Before receiving the Inventory Initiated command, the LRIS2K must have received an Initiate or a Fast Initiate command in order to set the Initiate_ flag. If not, the LRIS2K does not answer to the Inventory Initiated command.

On receiving the Inventory Initiated request, the LRIS2K runs the anticollision sequence. The Inventory_flag must be set to 1. The meaning of flags 5 to 8 is given in *Table 19:* Request_flags 5 to 8 when Bit 3 = 1.

The request contains the:

- flags
- Inventory command code
- AFI option not supported, AFI_flag must be set to 0
- mask length
- mask value
- CRC

The LRIS2K does not generate any answer in case of error.

Table 86. Inventory Initiated request format

| Request SOF | Request _flags | Inventory Initiated | IC MFG code | Optional AFI | Mask length | Mask value | CRC16 | Request EOF |
|----------------|-------------------|------------------------|----------------|-----------------|----------------|-------------|---------|----------------|
| | 8 bits | D1h | 02h | 8 bits | 8 bits | 0 - 64 bits | 16 bits | |

The response contains the:

- flags
- unique ID

Table 87. Inventory Initiated response format

| Response SOF | Response_flags | DSFID | UID | CRC16 | Response EOF |
|--------------|----------------|-------|---------|---------|--------------|
| | 8 bits | 0x00 | 64 bits | 16 bits | |

During an Inventory process, if the VCD does not receive an RF LRIS2K response, it waits a time t_3 before sending an EOF to switch to the next slot. t_3 starts from the rising edge of the request EOF sent by the VCD.

- If the VCD sends a 100% modulated EOF, the minimum value of t₃ is: t₃min = 4384/f_C (323.3µs) + t_{SOF}
- If the VCD sends a 10% modulated EOF, the minimum value of t_3 is: t_3 min = 4384/ t_C (323.3 μ s) + t_{NRT}

where:

- t_{SOF} is the time required by the LRIS2K to transmit an SOF to the VCD
- t_{NRT} is the nominal response time of the LRIS2K

 $t_{\mbox{\footnotesize NRT}}$ and $t_{\mbox{\footnotesize SOF}}$ are dependent on the LRIS2K-to-VCD data rate and subcarrier modulation mode.

LRIS2K Initiate

44 Initiate

On receiving the Initiate command, the LRIS2K sets the internal Initiate_flag and sends back a request. The command has to be issued in the Non Addressed mode only (Select_flag is reset to 0 and Address_flag is reset to 0). If an error occurs, the LRIS2K does not generate any answer. The Initiate_flag is reset after a power off of the LRIS2K.

Maximum rating LRIS2K

45 Maximum rating

Stressing the device above the rating listed in the absolute maximum ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Table 90. Absolute maximum ratings

| Symbol | Parameter | Min. | Max. | Unit | |

^{3.} Machine model.

46 DC and AC parameters

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC characteristic tables that follow are derived from tests performed under the measurement conditions summarized in the relevant tables. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

AC characteristics^{(1) (2)} Table 91.

| Symbol | Parameter | Condition | Min | Тур | Max | Unit |
|-------------------------------------|--|---------------------|--------|--------|--------|------|
| f _{CC} | External RF signal frequency | | 13.553 | 13.56 | 13.567 | MHz |

| V _{RET} | Retromodulated induced voltage | | ISO10373-7 | 10 | | | mV |
| I _{CC} Supply of | Supply ourrent | Read | V _{CC} = 3.0 V | | | 50 | μΑ |
| | Write | | V _{CC} = 3.0 V | | | 150 | μA |
| C _{TUN} | Internal tuning capacitor | | f = 13.56 MHz for SBN18/1 | | 21 | | pF |

^{1.} $T_A = -20 \text{ to } 85 \,^{\circ}\text{C}$.

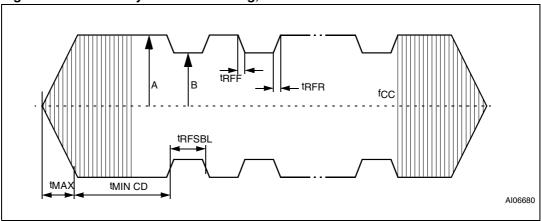

Table 93. Operating conditions

| Symbol | Parameter | Min. | Max. | Unit |
|----------------|-------------------------------|------|------|------|
| T _A | Ambient operating temperature | -20 | 85 | °C |

Figure 59 shows an ASK modulated signal, from the VCD to the LRIS2K. The test condition for the AC/DC parameters are:

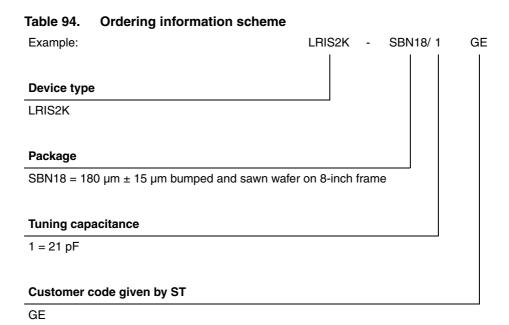

- Close coupling condition with tester antenna (1mm)
- LRIS2K performance measured at the tag antenna

Figure 59. LRIS2K synchronous timing, transmit and receive

LRIS2K Part numbering

47 Part numbering

Appendix A Anticollision algorithm (Informative)

The following pseudocode describes how anticollision could be implemented on the VCD, using recursivity.

A.1 Algorithm for pulsed slots

```
function push (mask, address); pushes on private stack
function pop (mask, address); pops from private stack
function pulse_next_pause; generates a power pulse
function store(LRIS2K UID); stores LRIS2K UID
function poll_loop (sub_address_size as integer)
  pop (mask, address)
  mask = address & mask; generates new mask
           ; send the request
  mode = anticollision
  send Request (Request cmd, mode, mask length, mask value)
  for sub address = 0 to (2<sup>sub</sup> address size - 1)
    pulse next pause
     if no collision is detected; LRIS2K is inventoried
       then
         store (LRIS2K UID)
       else; remember a collision was detected
         push (mask, address)
       endif
    next sub address
  if stack not empty; if some collisions have been detected and
     then ; not yet processed, the function calls itself
       poll_loop (sub_address_size); recursively to process the
last stored collision
    endif
end poll loop
main cycle:
  mask = null
  address = null
  push (mask, address)
  poll loop(sub address size)
end main cycle
```

LRIS2K CRC (informative)

Appendix B CRC (informative)

B.1 CRC error detection method

The cyclic redundancy check (CRC) is calculated on all data contained in a message, from the start of the flags through to the end of data. The CRC is used from VCD to LRIS2K and from LRIS2K to VCD.

Table 95. CRC definition

| CRC definition | | | | | |
|----------------|---------|-------------------------------------|-----------|--------|---------|
| CRC type | Length | Polynomial | Direction | Preset | Residue |
| ISO/IEC 13239 | 16 bits | $X^{16} + X^{12} + X^5 + 1 = 8408h$ | Backward | FFFFh | F0B8h |

To add extra protection against shifting errors, a further transformation on the calculated CRC is made. The One's Complement of the calculated CRC is the value attached to the message for transmission.

To check received messages the 2 CRC bytes are often also included in the re-calculation, for ease of use. In this case, the expected value for the generated CRC is the residue F0B8h.

B.2 CRC calculation example

This example in C language illustrates one method of calculating the CRC on a given set of bytes comprising a message.

C-example to calculate or check the CRC16 according to ISO/IEC 13239

```
x^16 + x^12 + x^5 + 1
        POLYNOMIAL0x8408//
#define PRESET VALUE0xFFFF
#define CHECK VALUE0xF0B8
#define NUMBER OF BYTES4// Example: 4 data bytes
#define CALC CRC1
#define CHECK CRC0
void main()
  unsigned int current crc value;
  unsigned char array of databytes [NUMBER OF BYTES + 2] = \{1, 2, 3, 1\}
4, 0x91, 0x39};
  int
                number of databytes = NUMBER OF BYTES;
  int
                calculate or check crc;
                i, j;
  calculate or check crc = CALC CRC;
// calculate or check crc = CHECK CRC;// This could be an other
example
  if (calculate_or_check_crc == CALC_CRC)
```

CRC (informative) LRIS2K

```
number of databytes = NUMBER OF BYTES;
  }
         // check CRC
  else
      number_of_databytes = NUMBER_OF_BYTES + 2;
  current_crc_value = PRESET_VALUE;
  for (i = 0; i < number of databytes; i++)</pre>
      current crc value = current crc value ^ ((unsigned
int)array of databytes[i]);
      for (j = 0; j < 8; j++)
          if (current crc value & 0x0001)
              current crc value = (current crc value >> 1) ^
POLYNOMIAL;
          else
              current crc value = (current crc value >> 1);
      }
  }
  if (calculate or check crc == CALC CRC)
      current crc value = ~current crc value;
      printf ("Generated CRC is 0x%04X\n", current crc value);
      // current crc value is now ready to be appended to the data
stream
      // (first LSByte, then MSByte)
  else // check CRC
      if (current crc value == CHECK VALUE)
          printf ("Checked CRC is ok (0x%04X)\n",
current_crc_value);
      }
      else
          printf ("Checked CRC is NOT ok (0x%04X)\n",
current_crc_value);
```

Appendix C Application family identifier (AFI) (informative)

The AFI (application family identifier) represents the type of application targeted by the VCD and is used to extract from all the LRIS2K present only the LRIS2K meeting the required application criteria.

It is programmed by the LRIS2K issuer (the purchaser of the LRIS2K). Once locked, it cannot be modified.

The most significant nibble of the AFI is used to code one specific or all application families, as defined in *Table 96*.

The least significant nibble of the AFI is used to code one specific or all application subfamilies. Subfamily codes different from 0 are proprietary.

Table 96. AFI coding⁽¹⁾

| AFI Most significant nibble | AFI Least significant nibble | Meaning VICCs respond from | Examples / Note |
|--------------------------------------|---------------------------------------|------------------------------------|-------------------------------|
| '0' | '0' | All families and subfamilies | No applicative preselection |
| 'X' | '0 | 'All subfamilies of family X | Wide applicative preselection |
| 'X | ''Y' | Only the Yth subfamily of family X | |
| '0' | 'Υ' | Proprietary subfamily Y only | |
| '1 | "0', 'Y' | Transport | Mass transit, Bus, Airline, |
| '2 | "0', 'Y' | Financial | IEP, Banking, Retail, |
| '3 | "0', 'Y' | Identification | Access Control, |
| '4 | "0', 'Y' | Telecommunication | Public Telephony, GSM, |
| '5' | '0', 'Y' | Medical | |
| '6 | "0', 'Y' | Multimedia | Internet services |
| '7 | "0', 'Y' | Gaming | |
| 8 | "0', 'Y' | Data Storage | Portable Files, |
| '9 | "0', 'Y' | Item Management | |
| 'A | "0', 'Y' | Express Parcels | |
| 'B | "0', 'Y' | Postal Services | |
| 'C | "0', 'Y' | Airline Bags | |
| 'D | "0', 'Y' | RFU | |
| 'E | "0', 'Y' | RFU | |
| 'F' | '0', 'Y' | RFU | |

^{1.} X = '1' to 'F', Y = '1' to 'F'

Revision history LRIS2K

Revision history

Table 97. Document revision history

| Date | Revision | Changes |
|-------------|----------|---|
| 13-Jun-2006 | 1 | Initial release. |
| 19-Feb-2007 | 2 | Figure 1.1: Memory mapping added. Only bits set to '1' are programmed to the AFI and DSFID Registers (see Section 30: Write AFI and Section 32: Write DSFID. C _{TUN} typical value for W4/3 modified in Table 92: DC characteristics. Small text changes. |
| 07-Sep-2007 | 3 | 23.5 pF internal tuning capacitor (C _{TUN}) value added (see <i>Features on page 1</i> and <i>Table 92: DC characteristics</i> . V _{ESD} modified for MLP in <i>Table 90: Absolute maximum ratings</i> . |
| 08-Apr-2008 | 4 | Small text changes. Titles of <i>Table 62</i> and <i>Table 63</i> modified. Response parameters modified in <i>Section 35: Get Multiple Block Security Status on page 72.</i> UFDFPN8 package mechanical data updated and dimensions in inches rounded to four decimal digits instead of three in <i>Table 94: UFDFPN8 - 8-lead ultra thin fine pitch dual flat package no lead (MLP) mechanical data</i> |
| 16-Sep-2008 | 5 | LRIS2K products are no longer delivered in A1 inlays and A6 and A7 antennas. Table 94: Ordering information scheme clarified. |
| 24-Oct-2008 | 6 | Section 30: Write AFI and Section 32: Write DSFID: command descriptions modified. Small changes in Table 90: Absolute maximum ratings. |
| 15-Dec-2009 | 7 | Note added to Table 2: Memory map. Section 2: LRIS2K block security modified. Table 5: Read / Write protection bit setting and block protection status modified to include also the Password Control bits (Password Control bits table removed), Write Password paragraph modified. Addresses 1 and 2 removed from Table 7: LRIS2K block security protection after power-up and Table 8: LRIS2K block security protection after a valid presentation of password 1. Option_flag specified in Section 25: Read Single Block. Note added to Table 72: Protect status. |

LRIS2K Revision history

Table 97. Document revision history (continued)

| Date | Revision | Changes |
|-------------|----------|--|
| 30-Sep-2010 | 8 | Removed unsawn wafer (W4) and MLP8 (MBTG). Modified programming time to 5 ms. Removed 23, 28.5, and 97 pF tuning capacitor. Section 36: Kill: UID mandatory, and error code definition. Removed Option_flag in Section 27: Lock Block, Section 30: Write AFI, Section 31: Lock AFI, Section 32: Write DSFID, Section 33: Lock DSFID, Section 36: Kill. Specified Option_flag in Section 35: Get Multiple Block Security Status. Corrected IC reference in Table 59: Get System Info response format when Error_flag is NOT set. AFI_flag not supported by Fast Inventory and Inventory initiated commands (see Section 41: Fast Inventory Initiated, Section 43: Inventory Initiated). |
| 19-Sep-2011 | 9 | Updated Section 1: Description. Updated disclaimer on last page. |
